

# Methods

Methods can be used to...

- use the same piece of code throughout the whole program
- organize your program in a better way
- write clean and maintainable program

✓ Variables

✓ Conditions

✓ Loops

○ Methods

Each point  $k$  is connected to point  $k + 2$ , after wrapping around.

Point  $k$  is at  $\frac{k}{numSides} \times 360^\circ$

# Passing Parameters

- A method can accept **parameters** when it is called.
- Syntax:

```
private void name(parameters) {  
    /* ... method body ... */  
}
```

- The values of the parameters inside the method are set when the method is called.
- The values of the parameters can vary between calls.

For more on the geometry  
and properties of stars:

[http://en.wikipedia.org/wiki/Star\\_polygon](http://en.wikipedia.org/wiki/Star_polygon)

# Factorials

- The number **n factorial**, denoted **n!**, is

$$1 \times 2 \times 3 \times \dots \times (n - 1) \times n$$

- For example:
  - $3! = 1 \times 2 \times 3 = 6$ .
  - $5! = 1 \times 2 \times 3 \times 4 \times 5 = 120$
  - $0! = 1$  (by definition)
- Factorials show up everywhere:
  - Taylor series.
  - Counting ways to shuffle a deck of cards.
  - Determining how quickly computers can sort values.

# Returning Values

- A method may produce a value that can be read by its caller.
- To indicate that a method returns a value, specify the type returned in the method declaration:

```
private type name (parameters) {  
    /* ... method body ... */  
}
```

- A value can be returned with the **return** statement:

```
return value;
```

# Subtleties of `return`

- If a method has non-`void` return type, it must always return a value.

```
private int thisIsWrong(int x) {  
    if (x == 5) {  
        return 0;  
    }  
}
```

What do we return if `x != 5`?

# Subtleties of `return`

- If a method has non-`void` return type, it must always return a value.

```
private int thisIsLegal(int x) {  
    if (x == 5) {  
        return 0;  
    } else {  
        return 1;  
    }  
}
```

# Many Happy **return**s

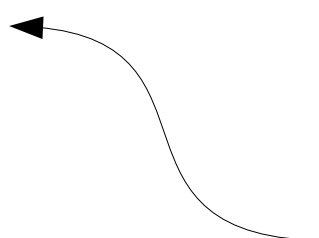

- A method may have multiple return statements. The method ends as soon as **return** is executed.

```
private int thisIsLegal(int x) {  
    if (x == 5) {  
        return 0;  
    } else {  
        return 1;  
    }  
}
```

# Many Happy **return**s

- A method may have multiple return statements. The method ends as soon as **return** is executed.

```
private int thisIsLegal(int x) {  
    if (x == 5) {  
        return 0;  
    }  
    return 1;  
}
```

The only way we can get here is if x is not equal to 5.

# Scope

- Each variable has a **scope** where it can be accessed and how long it lives.

```
for (int i = 0; i < 5; i++) {  
    int y = i * 4;  
}
```

```
i = 3; // Error!
```

```
y = 2; // Error!
```

# Scope of Method Calls

- A variable declared inside a method is called a **local variable**.
- Local variables can only be accessed inside of the method that declares them.

```
public void run() {  
    int x = 5;  
    someOtherMethod();  
}  
  
private void someOtherMethod() {  
    x = 4; // Error!  
}
```

```
public void run() {  
    for(int i = 0; i < MAX_NUM; i++) {  
        println(i + "! = " + factorial(i));  
    }  
}
```

i

### Console Program

```
public void run() {  
    for(int i = 0; i < MAX_NUM; i++) {  
        println(i + "! = " + factorial(i));  
    }  
}
```

i

0

### Console Program

```
public void run() {  
    for(int i = 0; i < MAX_NUM; i++) {  
        println(i + "! = " + factorial(i));  
    }  
}
```

i

0

### Console Program

```
public void run() {  
    for(int i = 0; i < MAX_NUM; i++) {  
        println(i + "! = " + factorial(i));  
    }  
}
```

i

0

### Console Program

```
public void run() {  
    for(int i = 0; i < MAX_NUM; i++) {  
        println(i + "! = " + factorial(i));  
    }  
}
```

# Retiring Young

# Pass-by-Value

- Java methods pass their parameters by **value**.
- The method gets a *copy* of its parameters, not the actual parameters themselves.

```
private void myMethod(int x) {  
    x = 137;  
}
```

```
public void run() {  
    int x = 42;  
    myMethod(x);  
    println("The value of x is " + x);  
}
```

This statement  
prints 42,  
not 137.

Slowing Things Down

# The **pause** Method

- The **pause** method has the signature  
`public void pause(double milliseconds) ;`
- **pause** waits the specified number of milliseconds, then returns.
- Examples:
  - `pause(1000) ;` waits for one second
  - `pause(50) ;` waits for one twentieth of a second.

# Operations on the GObject Class

The following operations apply to all `GObject`s:

**`object.setColor(color)`**

Sets the color of the object to the specified color constant.

**`object.setLocation(x, y)`**

Changes the location of the object to the point (x, y).

**`object.move(dx, dy)`**

Moves the object on the screen by adding *dx* and *dy* to its current coordinates.

Standard color names defined in the `java.awt` package:

`Color.BLACK`

`Color.RED`

`Color.BLUE`

`Color.DARK_GRAY`

`Color.YELLOW`

`Color.MAGENTA`

`Color.GRAY`

`Color.GREEN`

`Color.ORANGE`

`Color.LIGHT_GRAY`

`Color.CYAN`

`Color.PINK`

`Color.WHITE`

# Operations on the GObject Class

The following operations apply to all `GObject`s:

*`object.setColor(color)`*

Sets the color of the object to the specified color constant.

**`object.setLocation(x, y)`**

Changes the location of the object to the point (x, y).

**`object.move(dx, dy)`**

Moves the object on the screen by adding *dx* and *dy* to its current coordinates.

Standard color names defined in the `java.awt` package:

`Color.BLACK`

`Color.RED`

`Color.BLUE`

`Color.DARK_GRAY`

`Color.YELLOW`

`Color.MAGENTA`

`Color.GRAY`

`Color.GREEN`

`Color.ORANGE`

`Color.LIGHT_GRAY`

`Color.CYAN`

`Color.PINK`

`Color.WHITE`

# Animation

- By repositioning objects after they have been added to the canvas, we can create animations.
- General pattern for animation:

```
while (not-done-condition) {  
    update graphics  
    pause (pause-time) ;  
}
```

# Physics Simulation

<http://physbam.stanford.edu/~fedkiw/animations/glass00.avi>
